Abstract

The article deals with a highly relevant issue of ensuring maximum convenience when working with web content. Web Content Management Systems enable users to edit content fast. We present a classification of Web Content Management Systems and a general description of them. We also outline indicators of their reliability. We consider the main ideas behind Web Content Management Systems and explain the meaning of the following concepts: user interface, streamlined workflow, compatibility and scalability. We pay the most attention to the factors affecting the choice of a Web Content Management System. IT specialists may find this article to be of interest.
